Sac

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- Conventional view
 - Channel fades viewed as causing amplitude/phase distortion to transmitted symbols

- $h_1, h_2 \in \mathcal{CN}(0,1)$: Complex channel fades
- Detrimental to performance

Modulation approaches

・ロト ・ 同ト ・ ヨト ・ ヨト ・ ヨー

Sac

Background

- Media-based modulation
- Point-to-point GSM-MBM
- Multiuser MBM in massive MIMO systems
- Concluding remarks

- Alternate view
 - View complex channel fade coefficients themselves to constitute a modulation alphabet
 - $\mathbb{H} = \{h_i, i = 1, \cdots, M\}$ as the modulation alphabet

- How to create this alphabet?
 - transmit antennas, RF mirrors (parasitic elements)

Space shift keying

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- # tx. antennas, $n_t > 1$; # tx. RF chains, $n_{rf} = 1$
- Constellation: $\mathbb{H}_{ssk} = \{\mathbf{h}_1, \mathbf{h}_2, \cdots, \mathbf{h}_{n_t}\}$

Y. A. Chau and S.-H. Yu, "Space modulation on wireless fading channels," in *Proc. IEEE 54th VTC* 2001 (*Fall*), vol. 3, Oct. 2001, pp. 1668-1671.

Parasitic elements

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- Parasitic elements
 - capacitors, varactors or switched capacitors that can adjust the resonance frequency
- Use of parasitic elements external to antennas
 - Applications
 - beamforming, DoA estimation
 - selection/switched diversity
 - reconfigurable antennas
- Indexing using parasitic elements
 - *aerial modulation:* index orthogonal antenna patterns realized using parasitic elements
 - *media-based modulation:* index channel fades realized using RF mirrors

SSK, MBM

▲ロ ▶ ▲ 理 ▶ ▲ 国 ▶ ▲ 国 ■ ● ● ● ● ●

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- SSK
 - Multiple tx. antennas create channel fade alphabet $\mathbb{H}_{\mathsf{ssk}}$
 - Advantage
 - simple, need only 1 tx. RF chain, no interference
 - Issue
 - $|\mathbb{H}_{ssk}| = n_t$, $\eta_{ssk} = \lfloor \log_2 n_t \rfloor$ bpcu
 - need exponential increase in n_t to increase bpcu

SSK, MBM

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks

- SSK
 - Multiple tx. antennas create channel fade alphabet $\mathbb{H}_{\mathsf{ssk}}$
 - Advantage
 - simple, need only 1 tx. RF chain, no interference
 - Issue
 - $|\mathbb{H}_{ssk}| = n_t$, $\eta_{ssk} = \lfloor \log_2 n_t \rfloor$ bpcu
 - need exponential increase in n_t to increase bpcu
- MBM
 - Multiple RF mirrors create channel fade alphabet $\mathbb{H}_{\tt mbm}$
 - Advantage
 - $|\mathbb{H}_{mbm}| = 2^{m_{ff}}; \quad \eta_{mbm} = m_{ff}$ bpcu
 - bpcu increases linearly with m_{rf}
 - Issue
 - need to estimate $|\mathbb{H}_{mbm}|=2^{m_{rf}}$ constellation points at the rx. through pilot transmission

▲ロ ▶ ▲ 理 ▶ ▲ 国 ▶ ▲ 国 ■ ● ● ● ● ●

MBM capacity

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks • MBM with 1 tx. antenna and n_r rx. antennas achieves the capacity of n_r parallel AWGN channels as $m_{rf} \rightarrow \infty$.

MBM: An instance of index modulation

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks

- Index modulation
 - bits are conveyed through indices of transmit entities
- Examples
 - Indexing in spatial domain in multiantenna systems
 - SSK, SM, GSM
 - Indexing in frequency domain in multicarrier systems
 - subcarrier index modulation in OFDM
 - Indexing in space and frequency
 - GSFIM (generalized space-frequency index modulation)

▲ロ ▶ ▲ 理 ▶ ▲ 国 ▶ ▲ 国 ■ ● ● ● ● ●

- Indexing in space and time
 - STIM (space-time index modulation)
- Indexing precoders
 - PIM (precoder index modulation)
- Indexing RF mirrors
 - MBM (media-based modulation)

MBM signal set

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks

- MBM + conventional modulation
- A: a conventional modulation alphabet (e.g., QAM)
- Define $\mathbb{A}_0 \triangleq \mathbb{A} \cup 0$ and $N_m \triangleq 2^{m_{rf}}$
- MBM signal set: set of $N_m imes 1$ -sized vectors given by

$$\mathbb{S}_{\mathsf{mbm}} = \{ \mathbf{s} \in \mathbb{A}_0^{N_m} : \mathbf{s} = [0 \cdots 0 \underbrace{s}_{k \mathsf{th coordinate}} 0 \cdots 0]^T, \\ k \in \mathbb{A}, k = 1, \cdots, N_m \}$$

where k is the index of the MAP. $|S_{mbm}| = N_m |A|$

• Example: for $m_{rf} = 2$ and $|\mathbb{A}| = 2$ (i.e., BPSK),

- MBM signal vectors are sparse vectors
- $n_r \times 1$ rx. signal vector: $\mathbf{y} = s\mathbf{h}_k + \mathbf{n}$; k: MAP index

MAP selection

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- An MBM-TU may be designed to have more RF mirrors than actually used $(M_{rf} \ge m_{rf})$
- 2^{m_{ff}} best MAPs among 2^{M_{ff}} MAPs can be selected (similar to tx. antenna selection in multiantenna systems)
- Consider MAP selection in MIMO-MBM
- S_{all} : set of all possible MAPs per MBM-TU. $|S_{all}| = 2^{M_{rf}}$
- \mathbb{S}_{sub} : possible subset of \mathbb{S}_{all} . $|\mathbb{S}_{sub}| = 2^{m_{rf}}$
- Rx. estimates all $|S_{all}|$ constellation points, selects the best $|S_{sub}|$ among them, and sends the indices of the corresponding MAPs to the Tx.
- Tx. uses these selected MAPs to index the mirrors

Energy-based MAP selection

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks

- Choose the MBM constellation points with the highest energies
- $\mathbb{L}_{MI}^{j} = \{l_{j1}, l_{j2}, \cdots, l_{j|S_{sub}|}\}$: set of MAP indices corresponding to the $|S_{sub}|$ largest energies for the *j*th MBM-TU

$$\|\mathbf{h}_{l_{j1}}^{j}\|^{2} \geq \|\mathbf{h}_{l_{j2}}^{j}\|^{2} \geq \cdots \geq \|\mathbf{h}_{l_{j|\mathbb{S}_{\mathsf{sub}}|}}^{j}\|^{2} \geq \cdots \geq \|\mathbf{h}_{l_{j|\mathbb{S}_{\mathsf{all}}|}}^{j}\|^{2}$$

Sparsity-exploiting detection

・ロト ・ 同 ト ・ 三 ト ・ 三 ・ うへつ

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

- MBM signal vectors are inherently sparse
- An MBM signal vector has only one non-zero element out of N_m elements, leading to a sparsity factor of $1/N_m$
- Example: Let K = 16, $m_{rf} = 4$, $N_m = 2^{m_{rf}} = 16$. Out of $KN_m = 256$ elements, only 16 are non-zeros, resulting in a sparsity factor of $\frac{16}{256} = \frac{1}{16}$
- This inherent sparsity can be exploited for low complexity detection
- Sparse recovery algorithms like OMP, CoSaMP, and subspace pursuit (with necessary modifications) can be used

Sparsity-exploiting detection

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

```
Algorithm : Sparsity-exploiting detection of MU-MBM signals
   Inputs: y, H, K
   Initialize: i = 0
   repeat
        \hat{\mathbf{x}}_r = \frac{\mathbf{SR}(\mathbf{y}, \mathbf{H}, K+i)}{\mathbf{K}_r}
                                                               Sparse Recovery algorithm
        \mathbf{u}^{j} = \mathrm{UAP}(\hat{\mathbf{x}}_{r})
                                                           Extract User Activity Pattern
         if \|\mathbf{u}^{j}\|_{0} = K
             for q = 1 to K
                \hat{\mathbf{x}}^q = \operatorname{argmin} \|\hat{\mathbf{x}}^q - \mathbf{s}\|^2
                                                         ▷ Nearest MBM signal mapping
                         s∈Smbm
             end for
            break:
       else i = i + 1
       end if
   until j < K(N_m - 1)
   Output: The estimated MU-MBM signal vector
                                   \hat{\mathbf{x}} = [\hat{\mathbf{x}}^{1^T}, \hat{\mathbf{x}}^{2^T}, \cdots, \hat{\mathbf{x}}^{K^T}]^T

Background

Media-based modulation

- Point-to-point GSM-MBM
- Multiuser MBM in massive MIMO systems

- Media-based modulation
 - uses digitally controlled parasitic elements (RF mirrors) for modulation purposes
 - conveys information by indexing RF mirrors
 - offers rate, performance, hardware, and cost advantages
 - suited for point-to-point and multiuser communications
 - a promising modulation approach for next generation wireless (5G)

Background

Media-based modulation

Point-to-point GSM-MBM

Multiuser MBM in massive MIMO systems

Concluding remarks

Thank you
