Overview

1 MIMO

- 2 Spatial Modulation
- 3 Transmit Antenna Selection
- 4 Results

Conventional MIMO

- Multiple RF chains, hence, more hardware, and cost involved.
- Presence of ICI
- Antenna synchronization is required.
- Relatively high spectral efficient.

What is Spatial Modulation?

- A new modulation technique.
- It is open loop.
- Aided with single RF chain.
- Antenna indices also conveys information, besides the base constellation at the transmitter.

▲ロト ▲園 ト ▲ 臣 ト ▲ 臣 ト 一臣 - のへで

Spatial Modulation

No ICI

- No antenna synchronization is required.
- Low cost and hardware involved.

IISc

Past Works

Most of the recent works are focused on:

- Optimal receivers
- Bit error probability
- Power allocation

but these works assumes Gaussian alphabet which is less realized in practice.

J. Jeganathan, A. Ghrayeb, and L. Szczecinski, "Spatial modulation: optimal detection and performance analysis", IEEE Communication Letters, vol. 12, no. 8, pp. 545547, Aug. 2008 Sac K Satyanarayana, Chandra R. Murthy

Our Work

We focus on

- Maximizing the lower bound of mutual information for spatial modulation for Finite alphabets¹
- Minimizing the bit error probability

Assumption: CSI is globally available.

¹Signals drawn from constellation which are discrete and uniformly distributed. $\langle \Box \rangle \langle \overline{\partial} \rangle \langle \overline$

System model

$$y = h x_a x_d + z \tag{1}$$

- *a* and *d* denotes the antenna index, and data stream radiated from the transmitter.
- *h* is channel of size $1 \times N_t$ whose entities are i.i.d Rayeligh distribution $CN(0, \sigma^2)$

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○○○

Mutual Information

Mutual information for SM is calculated as

$$I(x_a, x_d; y) = H(y) - H(y|x_a, x_d)$$
⁽²⁾

For the system model described in Eq.1,

$$H(y|x_a, x_d) = H(z)$$

So, only H(y) in Eq.2 needs to be maximized.

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○○○

$$H(y) = \log_2(N_t M) - \frac{1}{N_t M} \sum_{k_1=1}^{N_t} \sum_{i_1=1}^M \mathbb{E}_z \left[\log_2 \left(\sum_{k_2=1}^{N_t} \sum_{i_2=1}^M \frac{1}{\pi \sigma^2} - \exp\left(-\frac{\|hx_a(k_1)x_d(i_1) - hx_a(k_2)x_d(i_2) + z\|^2}{\sigma^2}\right) \right) \right]$$
(3)

■ Using Jenson's inequality, Eq.3 can be lower bounded as:

K Satyanarayana, Chandra R. Murthy SM, TAS

Lower bound on Mutual Information

Lower bound on MI:

$$H(y) \ge \log_2(N_t M) - \frac{1}{N_t M} \sum_{k_1=1}^{N_t} \sum_{i_1=1}^M \log_2\left(\sum_{k_2=1}^{N_t} \sum_{i_2=1}^M \frac{1}{\pi \sigma^2} \cdot (4) \right) \\ \exp\left(-\frac{\|hx_a(k_1)x_d(i_1) - hx_a(k_2)x_d(i_2)\|^2}{2\sigma^2}\right)$$

K Satyanarayana, Chandra R. Murthy SM, TAS

IISc

From the above expression, it is obvious that, maximizing the distance between two symbols maximizes the lower bound.

Figure: Constellation points with, $N_t = 4$

Э

《曰》 《聞》 《臣》 《臣》

Precoder Design

We maximize the minimum distance (dmin) as follows:

- Channel phase compensation
- Constellation rotation

Remark: Excluding any of the above steps i.e., (employing only channel phase compensation or constellation rotation) will aggravate the performance.

K Satyanarayana, Chandra R. Murthy SM, TAS

Transmit Antenna Selection

- It is closed loop
- Aided with single RF
- Low cost and complexity
- No ICI
- No antenna synchronization.

Past/Recent Works

- Antenna selection with Alamouti shceme
- Secure transmission using TAS
- Antenna selection using imperfect CSIT.

Shihao Yan, Nan Yang, Robert Malaney, and Jinhong Yuan, "Transmit Antenna Selection with Alamouti Scheme in MIMO Wiretap Channels", available at arXiv:1303.5157v1

K Satyanarayana, Chandra R. Murthy SM, TAS

Transmit Antenna Selection

System Model:

$$y_{\rm tas} = h_{\rm max} x_{\rm tas} + z \tag{5}$$

Mutual Information

$$I(x_{\text{tas}}; y_{\text{tas}}) = \log_2(Q) - \frac{1}{Q} \sum_{k_1=1}^{Q} \mathbb{E}_z \left[\log_2 \left(\sum_{k_2=1}^{Q} (6) - \frac{\|h_{\text{max}}(x_{\text{tas}}(k_1) - x_{\text{tas}}(k_2)) + z\|^2 - \|z\|^2}{\sigma^2} \right) \right]$$

K Satyanarayana, Chandra R. Murthy SM, TAS

SM or TAS?

We compare spatial modulation and transmit antenna selection in terms of following metrics:

- Mutual Information
- Symbol Error Rate
- Outage Probability

We also investigated the behavior of mutual information with the increase in transmit antennas.

IISc

Performance Metrics

Symbol detection

ML is the optimal receiver, and is given by

$$\hat{x} = \arg\min_{a,d} \|y - hx_a x_d\|^2 \tag{7}$$

Outage Probability

Outage is reported if rate r is less than r_t :

$$P_{\text{out}} = \mathbf{P}(r < r_t \mid \mathbf{C}) \tag{8}$$
